Validity of Speaking Test According to Fraenkel et al. (2012), content validity refers to the nature of the material included in the instrument as well as the specification used by the researchers to create the content. A content validity is critical since it is an accurate measure of what it is meant to measure. The writer used expert judgment to determine the validity of the speaking exam using content validity. There were two experts evaluating the test whether it is suitable or not. In relation to this, there are certain factors to consider while selecting a validator. He/she must have a minimum TOEFL score of 550, at least 5 years of teaching experience, and a Master's degree in English major.

6.3. Reliability of PSCAS Questionnaire The writer used Cronbach Alpha as a reliability test that was used as a determinant of a research instrument. The questionnaire used in this study was designed by Yaikhong and Usaha (2012) in their work titled Public Speaking Class Anxiety Scale. The PSCAS Questionnaire has 17 items. Sujarweni (2014) explained the criteria for a research instrument reliable by using the Cronbach Alpha formula if the reliability coefficient was > 0.60 . The reliability coefficient of the Public Speaking Class Anxiety Scale was defined in the table 4. Based on the table, the coefficient of the Cronbach's Alpha was 0,637. The score was the result of a try out questionnaire conducted by the writer in a different school from the research destination school with the same grade and the same number of samples. In brief, because the PSCAS Questionnaire's coefficient values were more than 0.60, it was considered reliable to be used in this study.

6.4. Reliability of Speaking Test Furthermore, to acquire the reliability of speaking test, the writer used inter-rater reliability. In this study, the writer used two raters to measure speaking ability of students. Landis and Koch (1977) described the interpretation of level agreement to see the results of inter-rater calculations according to the reliability degree category. The interpretation of level agreement can be seen in the table 5. Brown (2004) stated that inter-rater reliability occurs when two or more scores yield inconsistent scores of the same test, possibly for lack of attention to score criteria, inexperience, inattention, or even preconceived biases. The result reliability of speaking test was defined in table 6. Based on the table, the coefficient of the Cronbach's Alpha was 0,754. Because the value is more than 0,60, it means that the reliability of the speaking test was reliable. The complete result of the tryout of the instruments that was done in eighth grade of SMPN 3 Tanjung Raja.

7. Data Analysis After distributing the

questionnaire and speaking test, the writer would be checked and evaluate the data.

7.1. Data Description Distribution of Frequency Data

The PSCAS questionnaire score and speaking achievement would be analyzed in the distribution of frequency data. SPSS would be used to obtain the frequency data result. Descriptive Statistic The number of samples, minimum and maximum scores, mean, standard deviation, and standard error of the mean are all obtained in descriptive statistics. PSCAS questionnaire scores and speaking achievement used to generate descriptive statistics. The findings of the descriptive statistical analysis obtained using SPSS

7.2. Normality Test

The normality test used to determine if the distribution of all data is normal; the data comes from a questionnaire and a test. When the p- value is more than 0.05, the data is regarded as normal. The Kolmogorov- Smirnov by SPSS is used to determine normality.

7.3. Linearity Test

The Test for Linearity used to determine the linearity of data. It determines whether or not students' PSCAS questionnaire scores and speaking test data are linear. When the p-output is more than 0.05 and the F-value is less than the F-table, data linearity is discovered.

8. Hypotheses Testing

8.1. Correlation Analysis

The significance of the correlation coefficient would be determined by comparing the data of the coefficient r data in the table of product moment with a level of significance of 5%. (r table). The correlation coefficient may be significant if the r table revealed less than r data at a level of significance of 5%.

8.2. Regression Analysis

Regression analysis was used to determine the contribution of speaking anxiety to speaking achievement of eighth grade students at SMPN 1 Tanjung Raja. Schneider, Hommel and Blettner (2010) explained that regression analysis employs a model that describes the relationships between the dependent variables and the independent variables in simplified mathematical forms. In addition, Cohen, Manion, and Marrison (2007) stated that regression aims to determine the value one variable in relationship to other that describes the compatibility of the relationship. Furthermore, all statistical statistics was done by the SPSS (Statistical Package for Social Science) computer application version 25.

FINDINGS AND DISCUSSION

There were several kinds of research findings in this study: (1) the result of students' speaking anxiety, (2) the result of students' speaking achievement, (3) the correlation between speaking anxiety and speaking achievement, and (4) the contribution of speaking anxiety to speaking achievement.

1. Research Method Therefore, speaking becomes a crucial ability that must be mastered in communication. In other hand, the goal of speaking is to communicate. According to Putra (2018), communication is the exchange of messages or news between two or more individuals in order for the message to be comprehended. As a result, in order to successfully deliver the information, the speaker must first comprehend what will be conveyed or communicated. Then, Cameron (2001) stated that speaking is the active use of language to express meanings so that the other people can make sense of them. A speaker must use the most suitable words and language to express meaning properly and exactly, as well as to organize the conversation so that the audience understands. They are speaking for more appropriate reasons here, such as knowledge sharing, requesting or offering something, and other communication purposes. The first procedure is for the writer to identify speaking anxiety by using a public speaking classroom anxiety scale questionnaire. The second procedure is for writers to obtain students' speaking achievement by doing a speaking test directly in class where they talked about certain topics determined by the rater. Then, the writer used SPSS to examine the correlation between variables based on the findings of the public speaking classroom anxiety scale and speaking test 2. Research Variables A correlation research has two variables: the prediction variable and the criterion variable. A predictor variable is a variable used to make a forecast about an outcome in correlation research. Meanwhile, the criteria variable is the variable that is influenced by or impacted by the prediction variable (Creswell, 2012). 3. Population of the Study The population is a generalization region made up of items or individuals with certain features and attributes that writer establish in order to learn and then deduce. According to Creswell (2012), the population is the group of individuals having one characteristic that distinguishes them from other groups. Johnson and Christensen (2014) stated that a population (sometimes called a target population) is the set of all elements. It is the large group to which a writer wants to generalize his or her sample results. The population of this study used the eighth grade students from SMPN 1 Tanjung Raja consisting of 4 classes. The population distribution can be seen in Table 2. 4. Sample of the Study Sample is a representative of population. Creswell (2012) explained the sample is representative of the population, and the results obtained during the study can be applied to the entire population. In this study, the writer used the

stratified random sampling approach to obtain the sample. According to Fraenkel, Wallen, and Hyun (2012), stratified random sampling is a method of selecting subgroups, or strata, in the same proportion as they exist in the population for the sample. The sample of this study can be seen in Table 3. Then, due to social limitations during the COVID-19 pandemic. This school makes restrictions on teaching and learning. Lessons are only done twice a week. Therefore, the writer used 8 students in each class as a representative with a total of 32 students. This is supported by the opinion of Creswell (2012) stated that correlational study that relates variables would require approximately 30 participants. As a result, it already provides the acceptable sample size for a correlational study.

5. Data Collection

The writer used a questionnaire and a speaking test as instruments in this study to collect data on the correlation between anxiety and speaking achievement of eighth grade students at SMPN 1 Tanjung Raja.

5.1. Questionnaire

In this research, the writer used the questionnaire as one of the instruments. According to Johnson and Christensen (2012), a questionnaire is a self-report data-collection tool that each research participant completes as part of a research study. The writer utilized public speaking class anxiety scale (PSCAS) questionnaire designed by Yaikhong and Usaha (2012) and delivered to the students to collect information regarding speaking anxiety. The PSCAS questionnaire has 17 questions that were connected to speaking anxiety.

5.2. The Speaking Test

The writer conducted a speaking test to get students' speaking achievement. The speaking test was given in the form of booklets. The booklets were split into two categories: a teacher's booklet and a student's booklet. Students were given different topics based on writer choice. The writer asked some questions related to the topic, it aims to find out students' understanding. Then, students were made a conversation based on the illustration in the students' booklet.

6. Validity and Reliability of Instrument

6.1. Validity of PSCAS Questionnaire

The validity of the instruments used in research is critical since the conclusions drawn by researchers are dependent on the information obtained using the instruments. According to Fraenkel et al. (2012), validity is the development of good evidence to indicate that the test interpretation is correct (of scores about the concept or construct that the test is assumed to measure). In this study, the writer will use ready-made public speaking class anxiety scale (PSCAS) by Yaikhong and Usaha (2012). In addition, the writer employed construct validity to explain the questionnaire's translation. Fraenkel et al. (2012) define construct validity as the nature of the psychological construct or feature being measured by the instrument. Following the construction of instruments connected to certain characteristics measured, it is required to obtain some expert judgment from at least two validators to determine if the instrument's components are valid or not to be used in research activities.

Currently, English is an essential language in our lives. According to Harmer (2007), English is a second or foreign language that people all around the world study. This is due to the fact that English has been designated as an international language, and individuals are required to study it. Then, the Indonesian government has determined that English will be one of the subject curriculums in Indonesian schools. It becomes a local subject in elementary school, a subject in junior high school, a subject in senior high school, and a subject in a higher education institution (Isnaini, 2018). As a result, it is believed that via their education, Indonesian students would be able to learn English. One of skills that students must master is speaking. Ozturk and Gurbuz (2014) explained that speaking is a productive one among four language skills. In today's language classrooms, students try to improve this productive skill in many ways. In addition, Misti (2018) assumed that speaking is one of the most crucial components of language acquisition that students should master. It is necessary to communicate what the speaker means to say as efficiently as possible in order to transmit the message to the listeners; nevertheless, if someone intends to say anything, they must be aware of how to build the meaning in order to gain an understanding from the listener and to avoid misunderstanding between speaker 2 and listener. Therefore, speaking becomes a crucial ability that must be mastered in communication. In other hand, the goal of speaking is to communicate. According to Putra (2018), communication is the exchange of messages or news between two or more individuals in order for the message to be comprehended. 5. Interpretation To strengthen the value of this study, an interpretation was made based on the results of data analysis. Based on the findings, there is no significant relationship between speaking anxiety and speaking achievement. Also, there was no significant effect of foreign language anxiety and speaking achievement. According to the PSCAS questionnaire findings, five students were found having low anxiety, Twenty four students were indicated having medium anxiety, and the three students were indicated having high anxiety. In short, moderate anxiety was the most felt by students. From the result of Pearson Product Moment Correlation, it was found that there was no correlation between speaking anxiety and speaking achievement of eighth grade students of SMPN 1 Tanjung Raja. This means that speaking anxiety had no correlation to their performance speaking achievement. There might be a reason why there was no significant correlation between students' speaking anxiety and their speaking achievement. The phenomenon that the writer saw when conducting research in grade 8 of SMPN 1 Tanjung Raja can be explained that most students lack confidence when learning to speak English. When the teacher called one of the students to come to the front of the class to read the text in English, they were asked to have a dialogue in English but they did not want to. Only a few students want to come to the front of the class to perform and they also looked nervous so what they display for dialogue was not clear due to lack of confidence. In addition, another factor is the lack of motivation. As previously, it explained about the lack of self-confidence of students. They were also afraid to come in front of the class because they were afraid of making mistakes in pronouncing words, and also making mistakes in grammar. Therefore, the students also found the difficult to express themselves in learning to speak English because of the lack of motivation in the minds of students. The insignificant finding most likely happened because speaking anxiety was not the only one factor influencing the students' speaking achievement. The most important criteria are motivation or confidence in speaking English. CONCLUSION Based on the findings and interpretations of this study, there were some conclusions that may be obtained. First, the result of Pearson Product Moment Correlation was r-obtained (.177) was lower than r-table (.349) for speaking anxiety and speaking achievement. The level of probability (p) significance (sig. 2-tailed) was .332. Since was more than .05, it means that there was no significant correlation between speaking anxiety and speaking achievement of eighth

grade students of SMPN 1 Tanjung Raja. Second, the insignificant result occurred since speaking anxiety was not only one factor that influenced the students'speaking achievement.
