INTRODUCTION English is one of the international languages used as a means of communication in the international relationship. Crystal (1997) states English is a global language. It means that English serves as a means of communication among people from a large number of countries in order to understand each other. Furthermore, Brown (2001) states that English has become a tool for international communication such as banking, tourism, politics, economics, arts, and education field (p.118). One of English language skills is reading. Reading is very important and has main role in our life. By reading, we can enrich our knowledge. Lane (2014) claims that reading is fundamental to many life activities and perhaps the most essential skill that children learn in school. In conclusion, without reading proficiency, students have problem to understand something. Reading is the main skill to reach successful study. However, reading is still a problem. Based on Organization for Economic Co-operation and Development (OECD) through Programme for International Language Assessment (PISA) survey, Indonesian students' reading in international language is still below the average score. In 2012 Indonesia's reading ranked in the 64th out of 65. In 2015 Indonesia ranked 62nd from 72 countries. Indonesia still ranked 64th out of 72 countries in 2018. Therefore it can be concluded that the students' achievement in reading skill in Indonesia is still low. This research highlighted some objectives as follows :

1) To find out whether or not there was any significant improvement on students' reading comprehension of recount text to the tenth grade students of SMA Negeri 11 Palembang by using PARS strategy. 2) To find out whether or not there was any significant difference in students' reading comprehension of recount text to the tenth grade students of SMA Negeri 11 Palembang between those who were taught by using PARS strategy and those who were not. Reading Problems Encountered by the Students Amalia (2017) states that the students of MAS Al-Washliyah 21 Firdaus could not read well. The students had low ability in reading comprehension. The first problem was that the students had got less information from reading activity. The second problem was that the students could not identify the main idea from each paragraph. The third problem was that the students had difficulty to comprehend the text they read. There are many factors that cause the low ability in reading comprehension those are internal and external factors. The internal factors are motivation, IQ (Intelligence Quotient), interest, talent etc. The external factors are teachers, friends, parents, facilities, including method of teaching

reading. Teaching method can influence the students' achievement in reading comprehension. The implementation of certain reading methods can lead a more effective teaching enviroment which can improve students' reading comprehension. The researcher focused on reading skill. The problems face by Indonesian student are students have low motivation in reading, teacher-centered learning so that the students tend to be passive, and the conventional method which is used in teaching process. Based on the English teacher's explanation, students of SMA Negeri 11 Palembang was still far from good in reading. The students still had problem in comprehending English text especially recount text and the students still get low score in reading. In addition, the teacher argued actually students need a new thing in learning English. Because of that, the researcher intended to use PARS strategy to improve students' reading comprehension. Based on the background above, the researcher would conduct a research entitled "Using PARS Strategy to Improve Reading Comprehension of Recount Text to the Tenth Grade Students at SMA Negeri 11 Palembang". PARS Strategy PARS strategy is one of the strategies that can be used by the students in teaching reading. PARS srategyy found by Cheek, E.H., & Creek, M.C in 1983. This reading comprehension strategy is a simplified textbook-reading strategy without much experience using textbook. The advantages of PARS strategy are: 1) to help the student obtain the information, 2) to help student to acquir greater understanding, 3) this strategy can attract the students' attention to be more enthusiastic in learning reading, 4) it is good way to train student's memory, and 5) it can help the student more active in the classroom. The followings are the procedures in conducting PARS strategy in teaching reading: a) Preview In this phase, the survey is designed to give students an overview of the content in order to help them active schema and assess their background. In surveying a chapter, student attempt to discover its content, what they already know about the topic, how interest they are content, how difficult the concepts are, and how the information is presented. b) Ask The questions give students specific idea to look for while reading. Keeping a question in mind can help maintain concentration on the reading's focus; greater concentration can then lead to improved comprehension and efficiency. Before formulating questions from the subheading, students should consider their general purposes by answering question. c) Reading Students read for answer to the question, they underline or take notes on information related to the question, as well as other information that seems important, relevant, and interesting. Read the easy bits faster and slow down for difficult new material. Stop when you need to think about what you have been reading. This activity is doing will help the readers receive the message from the text. d) Summarize Students are instructed to summarize by writing a paragraph that pulls together the key points of the information read. You may review once again to focusing on summarize the main points. This activity shows your understanding in reading the text.

METHODOLOGY A quasi experimental research design was carried out as the framework to conduct this scientific research. This research involved the tenth grade students of SMA Negeri 11 Palembang as the population in academic year 2017/2018. The design involved two groups, experimental and control group, as the sample. Those sample was chosen by using purposive sampling technique. The total numbers of the research participants were 85 students, divided into 43 students for experimental group and 42 students for control group. The judgments for choosing the sample were as follows: (1)) students had low achievement in reading comprehension, and (2) they were taught by the same teacher. Furthermore, reading test was administered to gather the data of students' reading comprehension. The test was given twice as pretest and posttest. Pretest was distributed before the treatment was carried out and the posttest was administered after the treatment session completed. The reading test consisted of 21 items of multiple choice. It was tried out prior to the data collection session. Previously, the researcher devised 50 items for the test. After try-out test, it was examined for the item validity using the corrected-item total correlation. The researcher compared the value of r-obtained per item with the value of r-table. The coefficient of r-table was (0.27). If the r-value is higher than or same with r-table, it means that the item is valid. If the r-value is lower than r-table, it means that the items is not valid. The invalid test items are deleted from the instrument. Based on the result of corrected-item total correlation analysis. It was found that 29 items of the instrument were not valid. While, the other 21 items of instrument were valid and they were used as the reading test items. Next, the data gathered were then analyzed by using paired sample t-test and independent sample t-test. These two analysis techniques were applied to verify the testing hypotheses of the research. Paired sample t-test was used to verify whether or not PARS strategy significantly improved students' reading comprehension of recount text, while Independent sample t-test was used to verify whether or not there was any significant difference in reading comprehension of recount text between students who were taught by using PARS strategy and those who were not. FINDING AND DISCUSSION There were some findings revealed after the data were analyzed. The data collected were analyzed by percentage analysis and inferential analysis. Reading Comprehension Level of Experimental Group This analysis was used to classify students' achievement of reading skill for both experimental and

control group before and after the treatment was administered. The summary of frequency analysis for experimental group is presented in Table 1. Based on the table above, it could be seen that before the treatment phase, 1 students (2.3%) were in excellent level; 15 students (34.8%) were in good level; 17 students (39.5%) were in average level; and 10 students (23.4%) were in poor level. Then, after the students got the treatment, it was found that 3 students (6.9%) were in excellent level; 22 students (51.2%) were in good level; 17 students (39,6%) were in average level; and 1 student (2.3%) were in poor level.

Reading Achievement Level of Control Group Meanwhile, the frequency analysis for control group in the pretest result revealed that 10 students (23.8%) were in good level; 23 students (54.8%) were in average level; and 9 students (21.4%) were in poor level. Then, in the post test, it was found that 21 students (50.0%) were in good level; 15 students (35.7%) were in average level; and 6 students (14.3%) were in poor level. The summary of frequency analysis for control group is presented in Table 2.

The Result of Paired Sample T-test Paired Sample T-Test was used to measure the progress of students' reading comprehension after being given the treatment. It was used to find out whether PARS strategy could improve students' reading comprehension or not. The summary of Paired Sample T-Test result is presented in Table 3 From he table above, it could be seen that the value of t-obtained (4.37) was higher than the value of t-table (2.01). Moreover, the significant value of Paired Sample T-Test (0.00) was lower than (0.05). It indicated that using PARS strategy could improve students' reading comprehension significantly. To sum up, it indicated that the null hyphothesis (H_0) was rejected and the alternative hyphothesis (H_a) was accepted.

The Result of Independent Sample T-test Independent sample t-test was administered to compare the result of post test from both control and experimental group. If the significant value of Independent Sample T-Test is less than 0.05, it indicates that there is a significant difference between the data from the two independent groups. Table 13 presents the result of Independent Sample T-Test. Based on the table above, it could be seen that the value of t-obtained (1.106) was lower than t-table (1.988). In addition, the significant value of Independent Sample T-Test (0.272) was higher than (0.05). It means that there was no significant difference in students' reading comprehension between those who were taught by using PARS strategy and those who were not. It indicated that null hyphothesis (H_0) was accepted and alternative hyphothesis (H_a) was rejected.

Conclusion Based on the findings and interpretations of the research, there were some points that could be concluded. First, it was significant using PARS strategy to improve recount reading comprehension to the tenth grade students of SMA Negeri 11 Palembang. It means that the null hyphothesis (H_0) was rejected and alternative hyphotesis (H_a) was accepted. Second, there was no significant difference between students who were taught by using PARS strategy and those who were not. It means that null hyphothesis (H_0) was accepted and alternative hyphothesis (H_a) was rejected.
